U.S. ENVIRONMENTAL PROTECTION AGENCY  
REGION V  
WASTE MANAGEMENT DIVISION

IN THE MATTER OF:  
PUBLIC MEETING  
VACANT LOT SITE

November 12, 1997  
7:00 p.m.

LOCATION:  
North Chicago Public Library  
2100 N. Argonne Drive  
North Chicago, Illinois

PRESENT:  
MR. JOHN J. O'GRADY  
MS. NOEMI EMERIC

Reported by:  
Virginia A. Gaiser, CSR

EPA Region 5 Records Ctr.

229854

INDEPENDENT COURT REPORTERS  
(847) 244-8121

1 MS. EMERIC: I want to welcome everyone  
2 to the meeting. My name is Noemi Emeric, and I'm  
3 a community involvement coordinator with the U.S.  
4 EPA. Tonight's meeting is to discuss the vacant  
5 lot site and what we title the EE/CA, which is  
6 really the Engineering, Evaluation and Cost  
7 Analysis, which will list the different cleanup  
8 alternatives that could be used at the site.

9 We're having a public comment  
10 period. If you received a fact sheet in the mail  
11 or if you saw the ad in the local paper, that  
12 means you're on our mailing list. As you  
13 understand there is a public comment period for  
14 30 days that started November 3 and ends December  
15 3. Tonight we will be accepting comments. They  
16 can be written or oral public comments. You can  
17 send them to me, fax them down or through the  
18 Internet which is -- on the backside of the agenda  
19 is my information with my telephone and my fax and  
20 Internet address.

21 I want to make sure that everyone  
22 does sign in. If you did not get the fact sheet  
23 in the mail that means you're not on our mailing  
24 list. If you sign in it will ensure that in the

1 future you will receive other fact sheets or any  
2 other pertinent information regarding the site.

3 We just want to encourage that your  
4 public comments are very important and the  
5 important role you would play in tonight's meeting  
6 or up until December 3rd regarding any comments  
7 you may have -- we do consider all the comments  
8 that are received.

9 Also, if you'll notice sitting up  
10 here to the left is a court reporter. She's going  
11 to be transcribing the meeting in its entirety and  
12 in about two weeks, maybe three weeks, we'll have  
13 the transcription of the meeting available here in  
14 the library. We have an information repository  
15 set up which also has the full EE/CA document. So  
16 if you want to look at it beyond what you read in  
17 the fact sheet, you'll get more technical  
18 information from there.

19 Tonight as we go through the agenda  
20 we will have Welcome and Introductions which I am  
21 doing now. John O'Grady who is the Remedial  
22 Project Manager will give the EE/CA presentation.  
23 We'll have a question-and-answer session and then  
24 public comment session.

1                   There is a distinct difference  
2           between the question-and-answer session and the  
3           public comment period session. During the  
4           question-and-answer session any questions or  
5           statements that you may have, we will respond to  
6           those. We'll try to answer your questions in the  
7           best way possible.

8                   During the public comment session,  
9           you can make your public comment in the form of a  
10          statement, question or just a general remark, but  
11          we cannot respond to those. That will be  
12          something that the transcriber will be taking and  
13          two weeks, possibly a month or so, after we've  
14          received all the comments, we have what's called a  
15          Responsiveness Summary, and that's where we'll  
16          respond to all the comments that are received.

17                  From there, that will be sent to the  
18          information repository. So if you'd like a copy  
19          of the responsiveness summary, please make sure  
20          you let me know and I'll mark it off on the  
21          sign-up sheet.

22                  We'd just ask that when you're  
23          giving your public comment that you be respectful  
24          of the of others' time. If you have a lot of

1        comments that you'd like to give, maybe you can  
2        give half of them at one time, three to five  
3        minutes, and maybe let someone else have an  
4        opportunity. And then you can come back later and  
5        give more comments.

6                    Now, we'll go ahead and let John  
7        give his presentation. He has instructed that  
8        while he's giving his presentation if you have  
9        questions, you can go ahead and ask him questions  
10       during his presentation.

11                   MR. O'GRADY: Good evening. Thanks for  
12       coming. My name is John O'Grady. I'm the  
13       Remedial Project Manager. My job at EPA is to  
14       manage the cleanup of Superfund sites or Superfund  
15       caliber sites.

16                   This particular site is a vacant lot  
17       site. It was known as the local Louisville  
18       Smelting Company site. It has been on the list,  
19       the surplus list, for a long time. The agency has  
20       been aware of it for a long time, but there's just  
21       so many sites out there that it takes a while to  
22       them.

23                   There was a fire back in 1988 at  
24       this site. It was understood that after they

1        investigated the fire -- basically they put the  
2        fire out and it would restart. It was caused by  
3        some sort of underground fire due to  
4        contamination. And that led initially to the  
5        first stages of the investigation that eventually  
6        brought the site to the state we're at today  
7        having done an extensive evaluation of it.

8                    Just so we're all clear about what  
9        we're talking about in terms of this site -- I'm  
10       sorry for the distortion in the pictures because  
11       of the way we're oriented here.

12                   Basically we're looking at the site  
13       that is bordered by Commonwealth Avenue on the  
14       west side of the site. To the south is 22nd  
15       Street or Martin Luther King Jr. Drive. To the  
16       north of the site is the railroad tracks, and to  
17       the east is the Fansteel property. It's roughly  
18       6.4 acres. There's a portion of the Pettibone  
19       Creek that runs through the site. That kind of  
20       gives us an idea of where we're at.

21                   In terms of the site itself, this is  
22       a close-up of the site. North is facing -- so  
23       this would be north up here, and we're looking at  
24       Pettibone Creek here. Up here are the railroad

1 tracks. On this side of the parking lot is the  
2 EMCO facility. Over on this side is the Fansteel  
3 property, 22nd Street.

4 The original fire took place  
5 somewhere in this area here. Also, in the course  
6 of our investigation, we found that the  
7 contamination in that area extended down to about  
8 the 8-, 10-foot level in certain areas.

9 We investigated the entire site, and  
10 one of the first things we did was we went out and  
11 obtained copies of any available report we could  
12 find and used that as background information and  
13 planned our sampling events so we didn't basically  
14 reinvent the wheel.

15 To give you an idea about how we  
16 went about sampling the site, we did a grid,  
17 roughly 80-by-80 foot piece. We knew that there  
18 would be a 95-percent confidence level in  
19 obtaining accurate information from that grid.  
20 Obviously we could have spent more money on a  
21 50-by-50 grid or 25-by-25.

22 We took soil borings down to  
23 basically 2 feet. We did it in two phases. We  
24 went out there the first time to find out in

1        general terms what's there throughout the course  
2        of the entire site. We also took sediment samples  
3        indicated by the triangles.

4                During the second phase we went  
5        back, and we looked at areas that were  
6        contaminated to determine how far or how deep they  
7        were contaminated both for sediment as well as  
8        soil areas.

9                We also did some Geoprobe sampling  
10       to get an idea of what's going on with  
11       groundwater. We did sampling of the monitoring  
12       wells.

13               The long and short of the entire  
14       investigation is that we were able to characterize  
15       fairly well what's going on out there in terms of  
16       groundwater sediment and soils. I already  
17       discussed this really. I jumped ahead of myself.  
18       I want to show this because Noemi spent a lot of  
19       time making very nice overheads for me. So  
20       80-by-80 sampling grid; collected soil, sediment  
21       and groundwater.

22               Phase II we did the Geoprobe. That  
23       basically is a drill rig that can go down --  
24       depending on the geology, it can go down in some

1 areas 50 feet, sometimes a little bit more than  
2 that. We didn't need to down 50 feet at this  
3 particular site. That groundwater table is around  
4 20 feet and sediment samples were up to 3 and a  
5 half feet.

6 SPEAKER: So you didn't go all the way to  
7 the water table?

8 MR. O'GRADY: We did go to the water  
9 table for the groundwater but not for soil  
10 samples. Basically we were able through the two  
11 phases characterize how deep the contamination  
12 is. In fact, there are areas on the site that are  
13 not that heavily contaminated in other areas as I  
14 mentioned. The area where the fire was is  
15 contaminated down to 8 to 10 feet in some areas.

16 After looking at the site and doing  
17 the analyticals it's basically a lead site. I  
18 would put it into that category. The primary  
19 contaminant of concern is lead. There's also  
20 Beryllium involved there and some VOCs in the  
21 soil.

22 As is typical with this kind of a  
23 site, generally the contamination can be usually  
24 collocated to clean up the lead. It can also get

1 at the VOCs and Beryllium. There are some areas,  
2 though, on the site that just show the metal  
3 contamination. Other areas show VOCs. But we  
4 have a good handle on that with the grid that we  
5 laid out.

6 So knowing that it's lead we asked  
7 our risk assessors, look at the scenario of this  
8 site not as a residential area, not as something  
9 where houses would be going up at, but rather if  
10 someone were to come in and want to put in a  
11 commercial establishment what would the lead  
12 levels need to be. We ran the adult lead model,  
13 and based on the demographics of the area we came  
14 up with 1,400 parts per million lead soil cleanup  
15 level. That means if the lead level is 1,400 or  
16 less that would be acceptable lead exposure for an  
17 onsite worker eight hours a day, 260 days a year.

18 We looked at the person that's most  
19 at risk, and under the lead adult model that would  
20 be a female of childbearing age because if she  
21 were pregnant, the child in her womb would be the  
22 most susceptible person at the site. So 1,400 is  
23 our cleanup level.

24 There are two ways to look at that

1 cleanup level. That is a risk-based cleanup  
2 level, which means technically if you wanted to  
3 really stretch things you can say, okay, I'll  
4 clean up to an average of 1,400. Some areas might  
5 be 2,100. Some areas might be 700. But what I  
6 decided to do was clean everything up to 1,400.  
7 That way I'm sure that what I leave on the site is  
8 going to be acceptable in terms of risk.

9 In fact, when you go in there and  
10 clean up to 1,400, you're really not going to find  
11 anything by the time I get finished. That's going  
12 to be at the 1,400 level. It's all going to be  
13 much, much less than that just because of the way  
14 the lead is deposited at the site.

15 So there's two ways that we need to  
16 approach the lead contaminated soil. First is  
17 there is -- you run what's called a TCLP Test.  
18 That's basically a test that tells us under rain  
19 water -- under acid rain conditions what's going  
20 to leach out of the soil, what kind of lead might  
21 possibly get into the groundwater. It's really a  
22 test that is based on a RCRA landfill scenario.  
23 If it fails this TCLP test we have to stabilize  
24 the material before a landfill will accept it.

1                   So there's two ways to look at the  
2                   lead. We're going to test all the lead, the  
3                   contaminated soil; and then those soils that fail  
4                   that particular test, that TCLP test, we'll need  
5                   to stabilize them. And then those that are not  
6                   not failing the tests we do not need to stabilize,  
7                   but simply need to document the levels and send it  
8                   off to the landfill.

9                   Am I clear so far? Am I going too  
10                  fast? Too slow? Boring?

11                  I also mentioned we took Geoprobe  
12                  samples and sediment samples.

13                  SPEAKER: On the soil, after the TCLP  
14                  where is it going to go?

15                  MR. O'GRADY: We don't know yet. It  
16                  depends on who does the job, if we do the job --  
17                  or if we find a potentially responsible party,  
18                  they will have the option to find the most  
19                  economical landfill. But it has to go to a RCRA  
20                  Subtitle D landfill, yes.

21                  MR. O'GRADY: There's two options. You  
22                  stabilize it onsite. Stabilizing the lead  
23                  contaminants is no big deal. It sounds real fancy  
24                  but it's basically a cement mixer -- don't quote

1 me to your consultants -- it's basically a pug  
2 mill, and it throws the soil in there. You add  
3 something like cement or kiln dust. You determine  
4 the ratio you need in order to stabilize the soil.  
5 That means how much of this stuff you need to add  
6 before you you don't fail the TCLP test. You find  
7 that out and go through and stabilize the soil  
8 with the material, cement or kiln dust or some  
9 combination, and you ship it off to the landfill.

10 The other option, if you don't  
11 stabilize onsite you can send it off to a RCRA  
12 Subtitle TSDF, which is a Treatment Storage  
13 Disposal Facility. At that facility they will do  
14 the same thing, basically, you would have done  
15 onsite and then you have the option of taking it  
16 either to that same facility for final disposal at  
17 their RCRA Subtitle D cell or to some other  
18 place. We're looking at the most economical  
19 alternative. We're not driving people in any one  
20 direction.

21 There's groundwater and sediment  
22 contamination. We've acknowledged that, but we've  
23 also said in our Engineering Evaluation/Cost  
24 Analysis that at this point in time we are not

1       going to clean it up. The reason is that it's  
2       clear to us that there are sources of  
3       contamination off site that are causing the  
4       problem.

5                       With respect to sediments, it's not  
6       clear but it does appear that the sediments became  
7       contaminated from something upstream or may have  
8       become contaminated from something upstream.  
9       Something being another sewer line upstream,  
10      another industry upstream. It could be historic  
11      contamination. It could be current  
12      contamination. We're not sure at this point in  
13      time.

14                     All we're saying is before we go in  
15      there and excavate the sediment we're basically  
16      proposing you would go there and excavate 2 to 4  
17      feet of sediment -- and based on the analysis it  
18      appears to be more like 4 feet of sediment --  
19      before we go doing that and then claim that the  
20      site is cleaned and having it be recontaminated,  
21      we want to determine the upstream source of  
22      contamination, get at those and then clean up the  
23      whole mess all at once.

24                     With respect to the groundwater

1       contamination the principal contaminant is  
2       trichloroethylene, otherwise known as TCE. And  
3       that definitely is coming onsite from an off-site  
4       location and we're working with parties with  
5       respect to that contamination. So the idea is  
6       that we get at the sources of that contamination  
7       and address the groundwater contamination that  
8       way. So far so good?

9               That pretty much lays out my  
10       presentation. There's one thing I did forget to  
11       add which I will re-add. I talked about sediment  
12       contamination. I talked about the soil  
13       contamination, the original fire area that  
14       probably we'll excavate to 8 to 10 feet.

15              There's another area of  
16       contamination in this area here of groundwater.  
17       Given that Pettibone Creek -- Groundwater flows  
18       something like this, toward Pettibone Creek; but  
19       on this side it flows in a different path. I'm  
20       not sure if that's the correct arrow. It might be  
21       something like that. I'd have to ask a  
22       hydrogeologist, but the point is it flows towards  
23       the creek. So it's not associated with the  
24       contamination on this side. What we're saying is

1       that we'll do some additional investigation in  
2       this area to find out where that contamination is  
3       coming from. There's one other point I left out.

4               SPEAKER: In that picture it seems like  
5       it's coming from the west then.

6               MR. O'GRADY: It appears to be coming  
7       from someplace in the west, but it could also be a  
8       pocket of contamination. It just needs to be  
9       further investigated at this point in time. We  
10      just didn't have time within the scope of this  
11      EE/CA. Basically the scope of this EE/CA was this  
12      6.4-acre lot. We didn't really go off-site.  
13      There are other studies done that have indicated  
14      other contamination.

15              There is one other area of  
16      contamination that needs to be further  
17      investigated. During one of the preliminary  
18      studies there was some -- Where is our site? Our  
19      site is here. (Pointing) There's some residential  
20      areas up to the north past the railroad tracks  
21      that during some initial investigations they did  
22      soil sampling, and there is some lead  
23      contamination in the soils. It's not at what I  
24      would call screamer levels. I'm not worried that

1 people are going to keel over dead. I don't mean  
2 to be flippant. But if it was at, for example,  
3 3,000 or 4,000 parts per million level, I would be  
4 real concerned. But we're talking about 700 or  
5 800 parts per million. That's higher than our  
6 residential risk scenario would allow under  
7 ordinary conditions.

8 Ordinary cleanup levels would be  
9 cleanup to about the 400-parts-per-million level.  
10 So we're talking about twice that. So that needs  
11 to be further investigated.

12 I would make a guess that that  
13 problem got there a long time ago from smelting  
14 operations. At least that's one scenario, one  
15 possible scenario. But, again, that's just a  
16 guess on my part and we would need to go out there  
17 and do more soil sampling and find out the entire  
18 extent of that lead contamination of the soil and  
19 then make the decision of whether or not that  
20 really needs to be addressed by a removal action,  
21 or can it be managed in some other way.

22 For example, those lead levels in  
23 the soil were basically based on soil borings  
24 which means you take a 1- or 2-foot core of soil.

1 Well, that soil is protected by a grass layer so  
2 right away there's a level of protection there.  
3 If there are driveways and things like that,  
4 obviously that would be essentially capping the  
5 lead contaminated soils.

6 So it just needs to be investigated  
7 and we need to have a risk assessor look at it.  
8 Again, it was outside of the scope of our  
9 investigation. We were aware of it, and it wasn't  
10 at levels that the agency would normally mobilize  
11 in a removal action.

12 SPEAKER: Do you have to know with  
13 relative certainty about your off-site  
14 contaminant, your silt sediment contaminant and  
15 your groundwater contaminant, before you go into  
16 any further action, like, with PRPs and that?

17 Can you decide that you feel you  
18 don't have a off-site surface flow contamination  
19 problem and so you could move forward with that as  
20 your alternative and still not be sure what's  
21 going on with the groundwater scenario? Or do you  
22 have to have a handle on everything before you can  
23 come up and say, okay, this alternative is what  
24 we're going to go with?

1 MR. O'GRADY: The way I've laid out the  
2 alternatives, I've laid them out in such a way  
3 that can address the onsite soil contamination now  
4 because it's not linked with the groundwater. And  
5 the groundwater is not cycling up and down in such  
6 a nature as to recontaminate clean fill.

7 SPEAKER: It's almost a secondary issue  
8 then?

9 MR. O'GRADY: It's another issue. It's  
10 equally as important. One of the most important  
11 considerations when we found groundwater  
12 contamination was not just what it was and what's  
13 the maximum contaminant level, but are there any  
14 receptors. Is anyone drinking the water? We did  
15 track that down and there basically are no  
16 receptors, but it does need to be addressed.

17 According to the policies and  
18 procedures that Congress has laid out for us, we  
19 just don't leave contaminated groundwater in  
20 place. First thing we do is find the source of  
21 that contamination.

22 The other question was about, what,  
23 sediment? Did you ask about that?

24 SPEAKER: Yes. If you determine that no

1 off-site contamination is going on at the surface,  
2 then you can go forward with the alternative?

3 MR. O'GRADY: If it's clear to us that  
4 there is no upstream contamination that would be  
5 there. So, for example, in a storm water event if  
6 there was a scouring effect in one of sewer lines,  
7 for example, that were coming onto the site, into  
8 Pettibone Creek, that would push additional  
9 contamination back on to the site -- if we were  
10 sure that wasn't going to happen then, yes, we  
11 could go forward with the cleanup of sediment on  
12 Pettibone Creek. But unless we really have a  
13 handle on that we're just wasting dollars if that  
14 were to happen. If we were to clean it up and it  
15 got recontaminated it would not make a lot of  
16 sense.

17 Any other questions about that?

18 (No response)

19 MR. O'GRADY: Now, we have the next  
20 step. So without stealing of any of Noemi's  
21 thunder what we're looking at is -- this is called  
22 an Engineering Evaluation/Cost Analysis or EE/CA.  
23 And the goal is if you're familiar with Superfund  
24 sites, this is similar to a Remedial

1 Investigation/Feasibility Study or an RI/FS. It's  
2 just a faster way to approach a site or approach  
3 it under slightly different authorities under the  
4 Superfund law.

5 We're looking for the public's  
6 comments on our approach to the site. And then  
7 based on your comments and our analysis of those  
8 comments we will choose a recommended alternative.  
9 It may be the one that we recommended in the fact  
10 sheet. It might be one that's different. Based  
11 on your comments it might be necessary for us to  
12 go out there and do a little bit more work. Then  
13 when all that's said and done and we've selected  
14 cleanup alternatives, then we will also be writing  
15 our responsiveness summary which basically takes  
16 each and every one of the comments that we receive  
17 and we respond to that comment.

18 Then we would have an action memo  
19 signed off by management at Region 5 in Chicago  
20 which would give us the legal authority to go in  
21 there and do the cleanup. Then we would be at a  
22 juncture where we would have to make one final  
23 attempt to say, okay, are there any potentially  
24 responsible parties that we can reasonably prove

1       has caused this contamination at this site.

2               If there are we would sit down with  
3       them and discuss their participation in the  
4       cleanup. If there aren't then the agency itself  
5       would pay for the cleanup out of the Superfund  
6       monies which are derived from a tax on oil-based  
7       products.

8               If we were to do this cleanup as  
9       described here, just the soil excavation, that  
10       could be done in a relatively short period of  
11       time. I would guess the time frame would be three  
12       months, stabilization, everything, start-up to  
13       finish. It's not a huge site. It might be four  
14       months, but it wouldn't be a long time.

15              In terms of additional studies to  
16       characterize the off-site sources of the  
17       groundwater contamination, that could take up to  
18       an additional year. The investigation of the  
19       residential areas, that could be probably much  
20       quicker because what we're basing our assumptions  
21       on at this point in time are a very few sampling  
22       points. We'd have to go out there and do  
23       additional sampling and find out if there is a  
24       problem and if there is a problem -- It's sort a

1       phased approach.

2                       In terms of the groundwater  
3       investigation to the west of the site, it could be  
4       another year. It depends. It might not be that  
5       big of a deal. It might be just a pocket of  
6       contamination. It could be something more  
7       extensive. It's just hard to evaluate at this  
8       point in time.

9                       Any questions about what I've presented?

10                      (No response)

11                      MR. O'GRADY: All right. Thank you very  
12       much. I'll turn the meeting back over to Noemi  
13       and we can enter, I guess, the public comment  
14       period of the session.

15                      MS. EMERIC: We may have a lot of public  
16       comments as I explained earlier. I think somebody  
17       walked in afterwards. John just gave the  
18       presentation on the Engineering Evaluation/Cost  
19       Analysis.

20                      Now we're going to move to our  
21       formal public comment period. In this session we  
22       do not respond to any of the comments, statements  
23       or questions you may have. You just make your  
24       statement, your question or your comment. It will

1 be recorded. Then we respond to it in our  
2 responsiveness summary.

3 If there are no other questions we  
4 can go directly to public comments, or if you'd  
5 like more discussion, more explanation from John  
6 we can do that.

7 Does anyone have any public  
8 comments? Any statements? No questions?

9 MR. JEEP: My name is Jeffery Jeep. I'm  
10 the general counsel for EMCO Chemical  
11 Distributors, Inc., the property right to the west  
12 of the subject property.

13 Have you identified responsible  
14 parties?

15 MR. O'GRADY: We are currently working  
16 with a company with respect to some of the  
17 problems we've found on the site. That's still in  
18 the negotiation phase.

19 In terms of determining which  
20 company or which entities may have caused the  
21 original contamination on the site itself we've  
22 not yet identified any potentially responsible  
23 parties. We're not finished with our work, but  
24 nobody is obviously coming to the forefront at

1       this point in time.

2               MR. JEEP: Can I ask another question?

3               MS. EMERIC: Sure.

4               MR. JEEP: Who owns the property?

5               MR. JEEP: The property is owned  
6       basically as a land trust held by the Northern  
7       Trust Bank. It was originally held by the Stack  
8       Family. Mr. Stack passed away and the land trust  
9       had certain levels of funding at one point time.  
10      They have expended virtually all their trust  
11      monies at this point in time doing limited site  
12      investigations. So basically there is not much  
13      there for us to go on.

14              SPEAKER: If it's determined there's no  
15      PRPs out there that are viable or willing to work  
16      with the EPA -- I'm the Devil's advocate --  
17      what's the priority level at the EPA for a cleanup  
18      when you already know what the story is and you  
19      have an alternative set up?

20              MR. O'GRADY: That's a good question. As  
21      I mentioned before this is being done under  
22      removal program authority. There's two programs  
23      within Superfund. One is removal and the other is  
24      remedial. Remedial is the program that everyone

1       has heard the horror stories about. The site's  
2       been out there 15 years and good old EPA hasn't  
3       done a thing with it.

4               The removal program can best be  
5       characterized by, well, we had a train wreck and  
6       they came out and they cleaned it up. This is  
7       being done under a Removal Program Authority.  
8       There's a ceiling on how much we can spend on the  
9       Removal Program Authority. Basically it's \$2  
10      million. And then once we pass that \$2 million  
11      mark, we have to get approval from headquarters.

12             This particular aspect of cleanup is  
13      under the \$2 million mark. In fact, if we did the  
14      sediment and the groundwater and the soil, it  
15      would be barely over \$2 million. So it's a fairly  
16      inexpensive remedy as remedy's go. \$2 million is  
17      a lot of money. I wish I had it myself. It's  
18      inexpensive, believe me.

19             Then you do a prioritization and is  
20      the money available. That's a question I really  
21      can't answer, but I think there would be a good  
22      indication that given the amount of money we need  
23      to spend out there if the agency were to take it  
24      on, there is a fairly high level of confidence

1 from my part at this point in time it could be  
2 funded in 1/98.

3 SPEAKER: What are some of the other  
4 alternatives? I've heard of where you can  
5 find -- if you do a market analysis -- find a  
6 potential developer who would be willing to come  
7 in and look at the site for whatever he wants do  
8 with it and take it, clean it up first or -- you  
9 know, where there's a trade-off.

10 How does that work, and at what  
11 point does that get looked at?

12 MR. O'GRADY: Brownsfield, for those who  
13 aren't aware is a program in EPA Superfund, that  
14 basically looks at abandoned industrial properties  
15 and says how can we best get this property back  
16 into use by the community. This site could fall  
17 under the Brownsfield program.

18 The fact always remains, though,  
19 that it does need to be cleaned up. There's  
20 levels of lead and other contaminants onsite that  
21 exceed the removal action levels. And until it's  
22 cleaned up it really can't be used for a  
23 commercial industrial scenario. What  
24 Brownsfield's program may do is assist the local

1 community in marketing the property perhaps.

2 SPEAKER: Would that come down as a  
3 recommendation from EPA, or would that be  
4 something that someone at the local level would  
5 have to get to?

6 MR. O'GRADY: I think that's more of  
7 where the local political environment would raise  
8 the level of awareness of the site and its  
9 importance to the community with EPA. And I  
10 really shouldn't say any more about Brownsfield  
11 because I don't know a whole lot of about it.

12 MS. EMERIC: I can kind of explain a  
13 little about that. I work on the Brownsfield team  
14 and I worked with a site that started out as this  
15 site is. And when we identified who the PRPs were  
16 they thought it was in their best interests  
17 instead of working with U.S. EPA under an  
18 enforcement action, they worked with the Illinois  
19 EPA and joined the Volunteer Cleanup Program. The  
20 PRP said, yes, we voluntarily admit we've caused  
21 some of this contamination and we'll join IEPA's  
22 program.

23 By joining this program the IEPA  
24 works with the PRP and makes the property more

1 marketable. Now, the PRP does not own the  
2 property, nor do they have future interest in it.  
3 But now some other developer may express interest  
4 in it because the site is being cleaned up by the  
5 PRP, and it gets them off that enforcement, off  
6 the PRP. It could also be done once we're able to  
7 identify the PRPs. Or if someone steps forward  
8 and says, yes, were interested in the site, they  
9 may be able to go through this voluntary program  
10 and get some breaks there.

11 MR. BURRIS: Bruce Burris, City Engineer,  
12 North Chicago. I think my question is similar to  
13 Fred's but coming at a different angle.

14 Say you do go in there and do the  
15 cleanup. Who owns the piece of property after the  
16 cleanup's done?

17 MR. O'GRADY: Well, obviously our program  
18 doesn't go in and clean up properties to make  
19 other people rich. There would be a lien against  
20 the property filed by the program. So that in the  
21 event it was sold by a private party, for example,  
22 we could recover part of the cost of the cleanup.

23 However -- correct me, Noemi --  
24 under a Brownsfield scenario if the property were

1 to come in the possession, for example, of the  
2 City of North Chicago or some municipality, then  
3 things like liens don't mean that much to us  
4 anymore. We generally don't want to own property.  
5 That might be a little different scenario.

6 MR. BURRIS: We have a storm sewer  
7 problem in this area. And what's why I asked that  
8 question. This may figure into it.

9 MR. O'GRADY: I was speaking with Fred  
10 before about the storm water problem. It's  
11 difficult because before we go clean up the  
12 sediment in that creek and improve the storm water  
13 drainage, we need to find out what's coming back  
14 on the site. So that would entail further  
15 investigation.

16 SPEAKER: I guess I'd like to make one  
17 more comment to put on the record, that the Lake  
18 County Storm Water Management Commission has been  
19 working with the City of North Chicago for the  
20 last, I'd say, five years on this site, on this  
21 particular site.

22 We got to the stage of design,  
23 review, permit at the State and Army Corps level  
24 to have this creek, which is right through the

1 site, maintained regraded and cleaned up so that  
2 the storm sewer system upstream would flow  
3 properly. Then we ran into the Superfund issue.  
4 So it kind of stopped in its tracks.

5 I just want to make sure that  
6 whatever is done that storm water and the City of  
7 of Chicago are integral partners in the final  
8 design, not necessarily the cleanup and  
9 remediation, but how the site is going to be when  
10 it's all said and done, final grading and all  
11 that. It's an important stretch in the storm  
12 sewer system of North Chicago.

13 MS. EMERIC: Any other comments or  
14 questions?

15 (No response)

16 MS. EMERIC: That's all we had on  
17 our agenda for tonight.

18 If there is anything else or if you  
19 want to send comments on the back of the agenda it  
20 has my name and telephone number and fax.

21 If you have any other questions or  
22 want to send in comments, the deadline is  
23 December 3. So make sure you get all your  
24 comments in by then. Thank you for coming.
